Portfolio

Introduction

I'm Parsa Tashakkori, also known as "theParsius", a game developer with a technical background and a deep passion for storytelling and design.

My journey into game development began with losing track of time while playing games and wondering how to create such experiences. This curiosity led me to a world where creativity and technical skills come together.

I started by focusing on the technical aspects of game development, but I have developed a growing passion for game and narrative design. Eager to dive deeper into these areas, I am fascinated by the potential to weave compelling stories and create immersive game experiences. I aspire to blend my technical skills with narrative and design elements in future projects.

On a personal note, I enjoy taking on new adventures and experiences. These activities not only provide a refreshing break from the digital world but also inspire and influence my game development approach in surprising ways. As I look forward, I am excited about the opportunities to push boundaries in game development.

My aim is to create games that are not only technically impressive but also emotionally resonant and thought-provoking, leveraging both my technical prowess and creative aspirations.

2022-2025

Honeyland

In “Honeyland,” a game merging Web2 and Web3 technologies on the Solana blockchain, players embark on missions with their NFT bees to collect items and HXD. My role included not only technical development using Unity and C# but also active involvement in design discussions, ensuring a smooth integration of blockchain elements. This project is a notable step in blending traditional gaming with innovative blockchain technology, offering players a unique global experience.

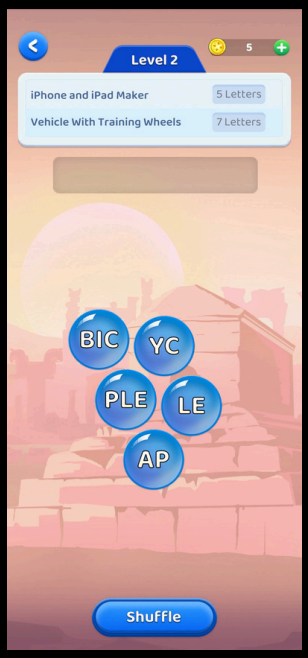

2025-Now

WordFly

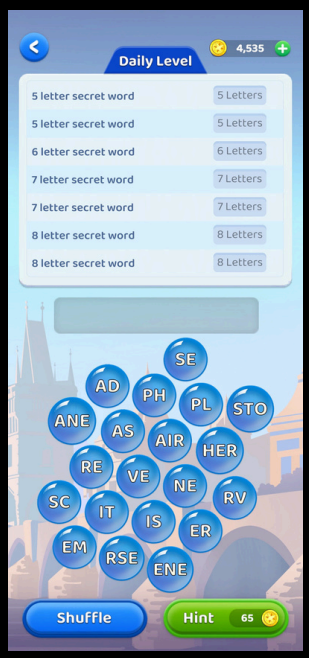

WordFly is a mobile puzzle game where players uncover hidden words in engaging levels. I worked on both the Unity client and the Golang server, focusing on smooth gameplay across online and offline modes. My main challenge was ensuring state consistency and performance, which I solved by carefully synchronizing client–server logic to create a seamless experience.

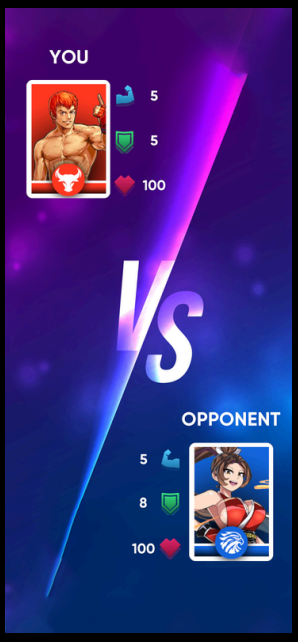

2025-Now

Dice Fight

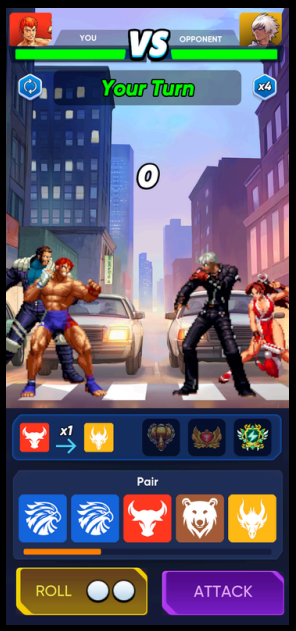

Dice Fight is a fast-paced combat prototype that blends fighting mechanics with dice-based strategy, roguelike progression, and Web3 features for casual mobile play. I developed the prototype in Unity and designed the combat system, focusing on meaningful choices that balance randomness with skill while keeping the experience accessible and engaging.

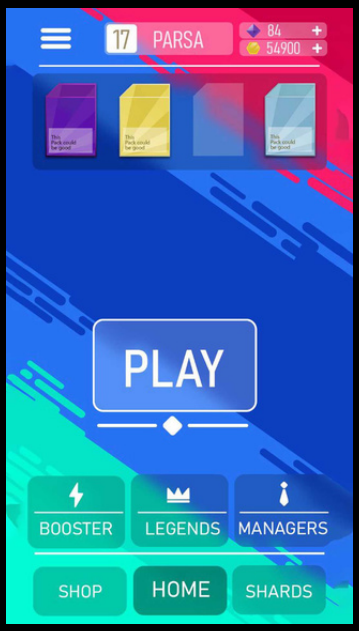

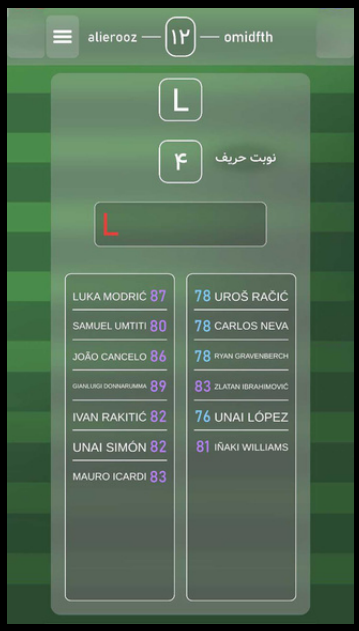

2021

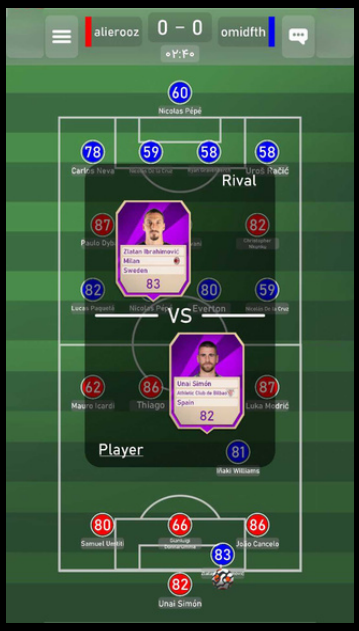

Line-Up

In the creation of “Line-Up,” a real-time online football game, players experience the excitement of drafting real football players to form their teams for virtual matches. My role involved utilizing Unity and C# for the game’s frontend development and Golang for the backend. I focused on blending sports management strategies with immersive gameplay, ensuring a seamless and engaging experience for players.

2022

Funtomime

"Funtomime" offers a digital twist on traditional charades, where players interact with video clues to guess actions. We used Unity and C# for the game's frontend and Golang for server-side functionalities. The game stands out for its user-generated content, allowing players to upload videos, thereby continuously enriching and diversifying the gameplay.

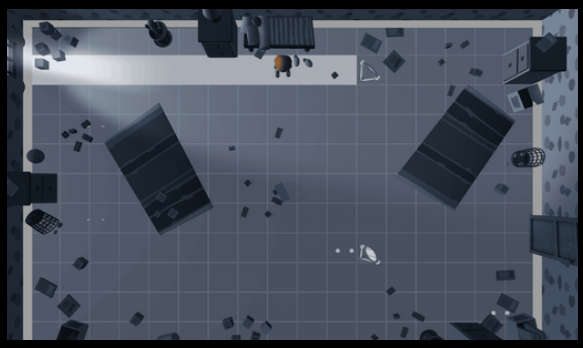

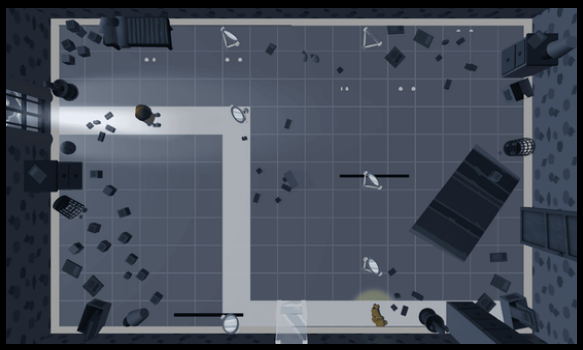

2021

Saving Private Teddy

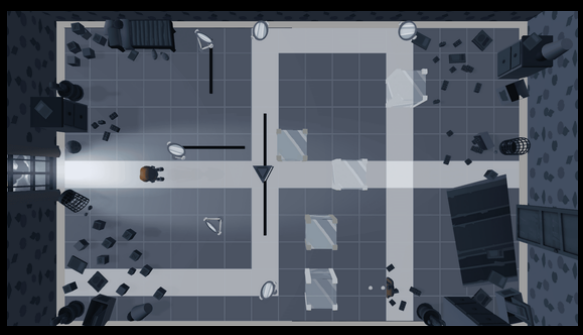

In “Saving Private Teddy,” a game created during a game jam with the theme “Delightful and Safe,” players guide a child through dark, eerie environments to find his lost teddy bear. Using Unity and C#, our team developed a unique puzzle game that emphasizes the contrast between light and darkness. My role involved not only the intricate design of the levels but also providing technical support to ensure seamless gameplay. This project highlights the innovative use of light to evoke a sense of safety in a scary setting, offering players a delightful yet thrilling experience.

2020

Agha Khan

This innovative online multiplayer project was designed to add a unique spin to the dynamics of familiar strategy games. A standout feature was the integration of dual spells for each hero, controlled by players, which added a new layer of engagement and strategy. My contribution involved using Unity and C# for the frontend and Golang for the backend development, focusing on crafting these complex game mechanics to enhance real-time player interaction.
